

Lipschitz condition

Definition: function $f(t, y)$ satisfies a **Lipschitz condition** in the variable y on a set $D \subset \mathbf{R}^2$ if a constant $L > 0$ exists with

$$|f(t, y_1) - f(t, y_2)| \leq L |y_1 - y_2|,$$

whenever $(t, y_1), (t, y_2)$ are in D . L is Lipschitz constant.

Lipschitz condition

Definition: function $f(t, y)$ satisfies a **Lipschitz condition** in the variable y on a set $D \subset \mathbf{R}^2$ if a constant $L > 0$ exists with

$$|f(t, y_1) - f(t, y_2)| \leq L |y_1 - y_2|,$$

whenever $(t, y_1), (t, y_2)$ are in D . L is Lipschitz constant.

- ▶ **Example 1:** $f(t, y) = t y^2$ does not satisfy any Lipschitz condition on the region

$$D = \{(t, y) \quad | \quad 0 \leq t \leq T\}.$$

Lipschitz condition

Definition: function $f(t, y)$ satisfies a **Lipschitz condition** in the variable y on a set $D \subset \mathbf{R}^2$ if a constant $L > 0$ exists with

$$|f(t, y_1) - f(t, y_2)| \leq L |y_1 - y_2|,$$

whenever $(t, y_1), (t, y_2)$ are in D . L is Lipschitz constant.

- ▶ **Example 1:** $f(t, y) = t y^2$ does not satisfy any Lipschitz condition on the region

$$D = \{(t, y) \quad | \quad 0 \leq t \leq T\}.$$

- ▶ **Example 2:** $f(t, y) = t y^2$ satisfies Lipschitz condition on the region

$$D = \{(t, y) \quad | \quad 0 \leq t \leq T, \quad -Y \leq y \leq Y\}.$$

What is going on with $f(t, y) = t y^2$?

Initial value problem

$$y'(t) = t y^2(t), \quad y(t_0) = \alpha > 0$$

has unique, but unbounded solution

$$y(t) = \frac{2\alpha}{2 + \alpha(t_0^2 - t^2)},$$

the denominator of which vanishes at

$$t = \sqrt{\frac{2}{\alpha} + t_0^2}.$$

- ▶ for $|t_0| < T$, ODE has unique solution on

$$D = \{(t, y) \mid 0 \leq t \leq T, -Y \leq y \leq Y\}.$$

- ▶ for $\sqrt{\frac{2}{\alpha} + t_0^2} < T$ ODE solution breaks down at $t = \sqrt{\frac{2}{\alpha} + t_0^2}$ on

$$D = \{(t, y) \mid 0 \leq t \leq T\}.$$

Well-posed problem

Definition in English: ODE is well-posed if

- ▶ A unique ODE solution exists, and
- ▶ Small changes (perturbation) to ODE imply small changes to solution.

Well-posed problem

The initial-value problem

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha, \quad (5.2)$$

is said to be a **well-posed problem** if:

- A unique solution, $y(t)$, to the problem exists, and
- There exist constants $\varepsilon_0 > 0$ and $k > 0$ such that for any ε , with $\varepsilon_0 > \varepsilon > 0$, whenever $\delta(t)$ is continuous with $|\delta(t)| < \varepsilon$ for all t in $[a, b]$, and when $|\delta_0| < \varepsilon$, the initial-value problem

$$\frac{dz}{dt} = f(t, z) + \delta(t), \quad a \leq t \leq b, \quad z(a) = \alpha + \delta_0, \quad (5.3)$$

has a unique solution $z(t)$ that satisfies

$$|z(t) - y(t)| < k\varepsilon \quad \text{for all } t \text{ in } [a, b].$$

Well-posed problem

Definition in English: ODE is well-posed if

- ▶ A unique ODE solution exists, and
- ▶ Small changes (perturbation) to ODE imply small changes to solution.

Theorem

Suppose $D = \{(t, y) \mid a \leq t \leq b \text{ and } -\infty < y < \infty\}$. If f is continuous and satisfies a Lipschitz condition in the variable y on the set D , then the initial-value problem

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha$$

is well-posed.

Well-posed problem, example

Show that the initial-value problem

$$\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5. \quad (5.4)$$

is well posed on $D = \{(t, y) \mid 0 \leq t \leq 2 \text{ and } -\infty < y < \infty\}$.

Solution: Because

$$\frac{\partial f}{\partial y}(t, y) = 1, \quad \left| \frac{\partial f}{\partial y}(t, y) \right| = 1.$$

$f(t, y) = y - t^2 + 1$ satisfies a Lipschitz condition in y on D with Lipschitz constant 1. Therefore this ODE is well-posed. In fact,

$$y(t) = 1 + t^2 + 2t - \frac{1}{2}e^t.$$

Euler's Method: Initial value ODE to solve

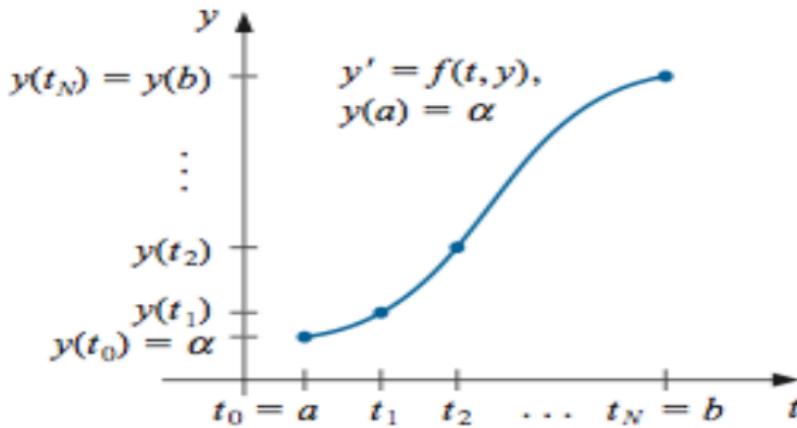

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Choose positive integer N , and select mesh points

$$t_j = a + j h, \quad \text{for } j = 0, 1, 2, \dots, N, \quad \text{where } h = (b - a)/N.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Choose positive integer N , and select mesh points

$t_j = a + j h, \quad \text{for } j = 0, 1, 2, \dots, N, \quad \text{where } h = (b - a)/N.$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Choose positive integer N , and select mesh points

$$t_j = a + j h, \quad \text{for } j = 0, 1, 2, \dots, N, \quad \text{where } h = (b - a)/N.$$

- ▶ For each j , do 2-term Taylor expansion

$$y(t_{j+1}) = y(t_j) + h y'(t_j) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N - 1.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Choose positive integer N , and select mesh points

$$t_j = a + j h, \quad \text{for } j = 0, 1, 2, \dots, N, \quad \text{where } h = (b - a)/N.$$

- ▶ For each j , do 2-term Taylor expansion

$$y(t_{j+1}) = y(t_j) + h y'(t_j) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N-1.$$

- ▶ Because $y(t)$ satisfies ODE,

$$y(t_{j+1}) = y(t_j) + h f(t_j, y(t_j)) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N-1.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Choose positive integer N , and select mesh points

$$t_j = a + j h, \quad \text{for } j = 0, 1, 2, \dots, N, \quad \text{where } h = (b - a)/N.$$

- ▶ For each j , do 2-term Taylor expansion

$$y(t_{j+1}) = y(t_j) + h y'(t_j) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N-1.$$

- ▶ Because $y(t)$ satisfies ODE,

$$y(t_{j+1}) = y(t_j) + h f(t_j, y(t_j)) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N-1.$$

- ▶ Ignore error term, set $w_0 = \alpha$,

$$w_{j+1} = w_j + h f(t_j, w_j), \quad j = 0, 1, \dots, N-1.$$

Euler's Method: Initial value ODE to solve

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

$$h = 0.2, \quad t_j = 0.2j, \quad \text{for } j = 0, 1, 2, \dots, 10.$$

- ▶ Set $w_0 = 0.5$. For $j = 0, 1, \dots, 9$,

$$\begin{aligned} w_{j+1} &= w_j + h(w_j - t_j^2 + 1) = w_j + 0.2(w_j - 0.04j^2 + 1) \\ &= 1.2w_j - 0.008j^2 + 0.2. \end{aligned}$$

Since $y''(t) = 2 - 0.5 e^t$, $\frac{\partial f}{\partial y}(t, y) = 1$,

it follows that $|y''(t)| \leq 0.5 e^2 - 2 \stackrel{\text{def}}{=} M, \quad L = 1$.

Euler's Method: example (II)

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$

exact solution $y(t) = (1+t)^2 - 0.5 e^t.$

- ▶ Therefore $M = 0.5 e^2 - 2, L = 1,$

$$|y(t_i) - w_i| \leq \frac{hM}{2L} \left(e^{L(t_i-a)} - 1 \right) = 0.1 (0.5 e^2 - 2) (e^{t_i} - 1).$$

Euler's Method: example (II)

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$
exact solution $y(t) = (1+t)^2 - 0.5 e^t.$

- ▶ Therefore $M = 0.5 e^2 - 2$, $L = 1$,

$$|y(t_i) - w_i| \leq \frac{hM}{2L} \left(e^{L(t_i-a)} - 1 \right) = 0.1 \left(0.5 e^2 - 2 \right) (e^{t_i} - 1).$$

$$\begin{aligned} y(t_{j+1}) &= y(t_j) + h y'(t_j) + \frac{h^2}{2} y''(\xi_j) \\ &= y(t_j) + h f(t_j, y(t_j)) + \frac{h^2}{2} y''(\xi_j), \quad j = 0, 1, \dots, N-1. \end{aligned}$$

- Euler's method for each j , in finite precision

$$u_{j+1} = u_j + h f(t_j, u_j) + \delta_{j+1},$$

where $|\delta_{j+1}| \leq \delta$.

- Subtraction of two equations:

$$y(t_{j+1}) - u_{j+1} = y(t_j) - u_j + h (f(t_j, y(t_j)) - f(t_j, u_j)) + \frac{h^2}{2} y''(\xi_j) - \delta_{j+1}.$$

Euler's Method in Finite Precision, II

- ▶ Difference of two equations:

$$y(t_{j+1}) - u_{j+1} = y(t_j) - u_j + h(f(t_j, y(t_j)) - f(t_j, u_j)) + \frac{h^2}{2} y''(\xi_j) - \delta_{j+1}.$$

Euler's Method in Finite Precision, II

- ▶ Difference of two equations:

$$y(t_{j+1}) - u_{j+1} = y(t_j) - u_j + h(f(t_j, y(t_j)) - f(t_j, u_j)) + \frac{h^2}{2} y''(\xi_j) - \delta_{j+1}.$$

- ▶ This implies a linear recursion:

$$\begin{aligned}|y(t_{j+1}) - u_{j+1}| &\leq |y(t_j) - u_j| + h |f(t_j, y(t_j)) - f(t_j, u_j)| + \frac{h^2}{2} |y''(\xi_j)| + |\delta_{j+1}| \\&\leq |y(t_j) - u_j| + hL |y(t_j) - u_j| + \frac{h^2}{2} M + \delta \\&= (1 + hL) |y(t_j) - u_j| + \frac{h^2}{2} M + \delta.\end{aligned}$$

Euler's Method in Finite Precision, II

- ▶ Difference of two equations:

$$y(t_{j+1}) - u_{j+1} = y(t_j) - u_j + h(f(t_j, y(t_j)) - f(t_j, u_j)) + \frac{h^2}{2} y''(\xi_j) - \delta_{j+1}.$$

- ▶ This implies a linear recursion:

$$\begin{aligned}|y(t_{j+1}) - u_{j+1}| &\leq |y(t_j) - u_j| + h |f(t_j, y(t_j)) - f(t_j, u_j)| + \frac{h^2}{2} |y''(\xi_j)| + |\delta_{j+1}| \\&\leq |y(t_j) - u_j| + hL |y(t_j) - u_j| + \frac{h^2}{2} M + \delta \\&= (1 + hL) |y(t_j) - u_j| + \frac{h^2}{2} M + \delta.\end{aligned}$$

- ▶ Further simplification for $j = 0, \dots, N-1$,

$$\begin{aligned}|y(t_{j+1}) - u_{j+1}| + \frac{hM}{2L} + \frac{\delta}{hL} &\leq (1 + hL) |y(t_j) - u_j| + \frac{h^2}{2} M + \frac{hM}{2L} + \delta + \frac{\delta}{hL} \\&= (1 + hL) \left(|y(t_j) - u_j| + \frac{hM}{2L} + \frac{\delta}{hL} \right).\end{aligned}$$

Euler's Method in Finite Precision, III

- ▶ Solving linear recursion:

$$\begin{aligned}|y(t_{j+1}) - u_{j+1}| + \frac{hM}{2L} + \frac{\delta}{hL} &\leq (1 + hL) \left(|y(t_j) - u_j| + \frac{hM}{2L} + \frac{\delta}{hL} \right) \\ &\vdots \\ &\leq (1 + hL)^{j+1} \left(|y(t_0) - u_0| + \frac{hM}{2L} + \frac{\delta}{hL} \right).\end{aligned}$$

- ▶ Assume $|y(t_0) - u_0| = |\alpha - u_0| \leq \delta$,

$$|y(t_{j+1}) - u_{j+1}| + \frac{hM}{2L} + \frac{\delta}{hL} \leq (1 + hL)^{j+1} \left(\delta + \frac{hM}{2L} + \frac{\delta}{hL} \right),$$

it follows that

$$\begin{aligned}|y(t_{j+1}) - u_{j+1}| &\leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left((1 + hL)^{j+1} - 1 \right) + \delta (1 + hL)^{j+1} \\ &\leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left(e^{L(t_{j+1}-a)} - 1 \right) + \delta e^{L(t_{j+1}-a)}.\end{aligned}$$

Euler's Method in Finite Precision, IV

- ▶ Error bound in finite precision

$$|y(t_{j+1}) - u_{j+1}| \leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left(e^{L(t_{j+1}-a)} - 1 \right) + \delta e^{L(t_{j+1}-a)}.$$

Euler's Method in Finite Precision, IV

- ▶ Error bound in finite precision

$$|y(t_{j+1}) - u_{j+1}| \leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left(e^{L(t_{j+1}-a)} - 1 \right) + \delta e^{L(t_{j+1}-a)}.$$

- ▶ Value of h can't be too small:

$$\lim_{h \rightarrow 0} \left(\frac{hM}{2} + \frac{\delta}{h} \right) = \infty.$$

Euler's Method in Finite Precision, IV

- ▶ Error bound in finite precision

$$|y(t_{j+1}) - u_{j+1}| \leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left(e^{L(t_{j+1}-a)} - 1 \right) + \delta e^{L(t_{j+1}-a)}.$$

- ▶ Value of h can't be too small:

$$\lim_{h \rightarrow 0} \left(\frac{hM}{2} + \frac{\delta}{h} \right) = \infty.$$

- ▶ "Optimal" value of h

$$h_{\text{opt}} = \sqrt{\frac{2\delta}{M}}, \quad \text{and} \quad \left(\frac{h_{\text{opt}} M}{2} + \frac{\delta}{h_{\text{opt}}} \right) = \sqrt{2\delta M}.$$

Euler's Method in Finite Precision, IV

- ▶ Error bound in finite precision

$$|y(t_{j+1}) - u_{j+1}| \leq \frac{1}{L} \left(\frac{hM}{2} + \frac{\delta}{h} \right) \left(e^{L(t_{j+1}-a)} - 1 \right) + \delta e^{L(t_{j+1}-a)}.$$

- ▶ Value of h can't be too small:

$$\lim_{h \rightarrow 0} \left(\frac{hM}{2} + \frac{\delta}{h} \right) = \infty.$$

- ▶ "Optimal" value of h

$$h_{\text{opt}} = \sqrt{\frac{2\delta}{M}}, \quad \text{and} \quad \left(\frac{h_{\text{opt}} M}{2} + \frac{\delta}{h_{\text{opt}}} \right) = \sqrt{2\delta M}.$$

- ▶ "Practical" value of $h \gg h_{\text{opt}}$.

Midterm Scope

- ▶ First 5 Chapters of Text Book.
- ▶ **Chapter 1:** Calculus, Computer Math.
- ▶ **Chapter 2:** Solve $f(x) = 0$.
- ▶ **Chapter 3:** Approximate given functions.
- ▶ **Chapter 4:** Derivatives, integrals.
- ▶ **Chapter 5:** Initial value ODEs, up to Section 5.3.

Review: Midterm rules

- ▶ No calculators.
- ▶ one-sided one-page cheat sheet.
- ▶ exam problems are mostly (modified) from exercises in textbook.
- ▶ free to use results in the proper text, but not anything else.

Chapter 1

- ▶ **Calculus**

- ▶ Extreme Value Theorem
- ▶ Mean Value Theorem
- ▶ Intermediate Value Theorem

- ▶ **Machine Precision**

- ▶ Round-off errors
- ▶ Stable quadratic roots
- ▶ Numerical stability

- ▶ **Rate of convergence: the Big O**

Root finders

- ▶ **Bisection**
- ▶ **Fixed Point Iteration**
- ▶ **Newton's Method**
- ▶ **Order of convergence**
- ▶ **Polynomial roots**
- ▶ **Multiple roots**

Able to develop, use, and analyze methods

Interpolation and Polynomial Approximation

- ▶ **Interpolation and the Lagrange Polynomial**
- ▶ **Error Analysis**
- ▶ **Divided Differences**
- ▶ **Hermite Interpolation**
- ▶ **Cubic Spline Interpolation**

Able to develop and analyze approximation methods

Numerical Differentiation and Integration

- ▶ Numerical Differentiation
- ▶ Extrapolation
- ▶ Trapezoidal/Simpson rules, DoP
- ▶ Composite Numerical Integration
- ▶ Adaptive Quadrature, error bounds vs. estimates
- ▶ Gaussian Quadrature
- ▶ Multiple/Improper Integrals

Able to develop and analyze basic integration methods

Initial-Value Problems for ODEs

- ▶ **Elementary Theory of Initial-Value Problems, Lipschitz conditions**
- ▶ **Euler's Method**
- ▶ **Higher-Order Taylor Methods**

Local Truncation Error for a general difference method

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Definition: The difference method

$$\begin{aligned} w_0 &= \alpha, \\ w_{j+1} &= w_j + h\phi(t_j, w_j), \quad \text{for } j = 0, 1, \dots, N-1 \end{aligned}$$

has **local truncation error**

$$\begin{aligned} \tau_{j+1}(h) &\stackrel{\text{def}}{=} \frac{y(t_{j+1}) - (y(t_j) + h\phi(t_j, y(t_j)))}{h} \\ &= \frac{y(t_{j+1}) - y(t_j)}{h} - \phi(t_j, y(t_j)). \end{aligned}$$

Local Truncation Error for Euler's method

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Euler's method

$$\begin{aligned} w_0 &= \alpha, \\ w_{j+1} &= w_j + hf(t_j, w_j), \quad \text{for } j = 0, 1, \dots, N-1 \end{aligned}$$

has **local truncation error**

$$\begin{aligned} \tau_{j+1}(h) &= \frac{y(t_{j+1}) - y(t_j)}{h} - f(t_j, y(t_j)) \\ &= \frac{y(t_{j+1}) - y(t_j)}{h} - y'(t_j) = \frac{h}{2} y''(\xi_j), \quad \xi_j \in (t_j, t_{j+1}). \end{aligned}$$

This implies

$$|\tau_{j+1}(h)| \leq \frac{h}{2} \max_{t \in [a, b]} |y''(t)| \stackrel{\text{def}}{=} \frac{hM}{2}, \quad \text{a first order method.}$$

n-th Order Taylor Methods:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

n-th Order Taylor Methods:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ ($n + 1$)-term Taylor expansion

$$\begin{aligned}y(t_{j+1}) &= y(t_j) + hy'(t_j) + \frac{h^2}{2}y''(t_j) + \cdots + \frac{h^n}{n!}y^{(n)}(t_j) \\&\quad + \frac{h^{n+1}}{(n+1)!}y^{(n+1)}(\xi_j).\end{aligned}$$

n-th Order Taylor Methods:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ ($n + 1$)-term Taylor expansion

$$\begin{aligned}y(t_{j+1}) &= y(t_j) + hy'(t_j) + \frac{h^2}{2}y''(t_j) + \cdots + \frac{h^n}{n!}y^{(n)}(t_j) \\&\quad + \frac{h^{n+1}}{(n+1)!}y^{(n+1)}(\xi_j).\end{aligned}$$

- ▶ On the other hand,

$$\begin{aligned}y'(t_j) &= f(t_j, y(t_j)), \quad y''(t_j) = f'(t_j, y(t_j)), \cdots \\y^{(n)}(t_j) &= f^{(n-1)}(t_j, y(t_j)).\end{aligned}$$

n-th Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

n-th Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ ($n + 1$)-term Taylor expansion

$$\begin{aligned}y(t_{j+1}) &= y(t_j) + hf(t_j, y(t_j)) + \frac{h^2}{2}f'(t_j, y(t_j)) + \cdots + \frac{h^n}{n!}f^{(n-1)}(t_j, y(t_j)) \\&\quad + \frac{h^{n+1}}{(n+1)!}f^{(n)}(\xi_j, y(\xi_j)).\end{aligned}$$

n-th Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ ($n + 1$)-term Taylor expansion

$$\begin{aligned}y(t_{j+1}) &= y(t_j) + hf(t_j, y(t_j)) + \frac{h^2}{2}f'(t_j, y(t_j)) + \cdots + \frac{h^n}{n!}f^{(n-1)}(t_j, y(t_j)) \\&\quad + \frac{h^{n+1}}{(n+1)!}f^{(n)}(\xi_j, y(\xi_j)).\end{aligned}$$

- ▶ n -th order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h\mathbf{T}^{(n)}(t_j, w_j), \quad j = 0, 1, \dots, N-1,$$

where $\mathbf{T}^{(n)}(t_j, w_j) = f(t_j, w_j) + \frac{h}{2}f'(t_j, w_j) + \cdots + \frac{h^{n-1}}{n!}f^{(n-1)}(t_j, w_j).$

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Second order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h \mathbf{T}^{(2)}(t_j, w_j), \quad j = 0, 1, \dots, N-1,$$

where $\mathbf{T}^{(2)}(t_j, w_j) = f(t_j, w_j) + \frac{h}{2} f'(t_j, w_j)$ with

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Second order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h\mathbf{T}^{(2)}(t_j, w_j), \quad j = 0, 1, \dots, N-1,$$

where $\mathbf{T}^{(2)}(t_j, w_j) = f(t_j, w_j) + \frac{h}{2}f'(t_j, w_j)$ with

$$\begin{aligned} f'(t, y(t)) &= \frac{d}{dt}f(t, y(t)) = \frac{\partial f}{\partial t}(t, y(t)) + \frac{\partial f}{\partial y}(t, y(t))y'(t) \\ &= \frac{\partial f}{\partial t}(t, y(t)) + \frac{\partial f}{\partial y}(t, y(t))f(t, y(t)). \end{aligned}$$

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Second order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h \mathbf{T}^{(2)}(t_j, w_j), \quad j = 0, 1, \dots, N-1,$$

where $\mathbf{T}^{(2)}(t_j, w_j) = f(t_j, w_j) + \frac{h}{2} f'(t_j, w_j)$ with

$$\begin{aligned} f'(t, y(t)) &= \frac{d}{dt} f(t, y(t)) = \frac{\partial f}{\partial t}(t, y(t)) + \frac{\partial f}{\partial y}(t, y(t)) y'(t) \\ &= \frac{\partial f}{\partial t}(t, y(t)) + \frac{\partial f}{\partial y}(t, y(t)) f(t, y(t)). \end{aligned}$$

- ▶ Second order Taylor method in explicit form

$$w_{j+1} = w_j + h \left(f(t_j, w_j) + \frac{h}{2} \left(\frac{\partial f}{\partial t}(t_j, w_j) + \frac{\partial f}{\partial y}(t_j, w_j) f(t_j, w_j) \right) \right).$$

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad f(t, y) = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5.$$

Example: Second Order Taylor Method:

$$\frac{dy}{dt} = f(t, y), \quad f(t, y) = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5.$$

- ▶ Second order Taylor method

$$w_{j+1} = w_j + h \left(f(t_j, w_j) + \frac{h}{2} \left(\frac{\partial f}{\partial t}(t_j, w_j) + \frac{\partial f}{\partial y}(t_j, w_j) f((t_j, w_j)) \right) \right).$$

$$\frac{\partial f}{\partial t}(t, y(t)) = -2t, \quad \frac{\partial f}{\partial y}(t, y(t)) = 1.$$

Thus,

$$\begin{aligned} w_{j+1} &= w_j + h \left(w_j - t_j^2 + 1 + \frac{h}{2} (-2t_j + w_j - t_j^2 + 1) \right) \\ &= \left(1 + h + \frac{h^2}{2} \right) w_j + \left(h + \frac{h^2}{2} \right) (1 - t_j^2) - h^2 t_j. \end{aligned}$$

Euler's Method vs. Second Order Taylor Method: $N = 10$

$$\frac{dy}{dt} = f(t, y), \quad f(t, y) = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5.$$

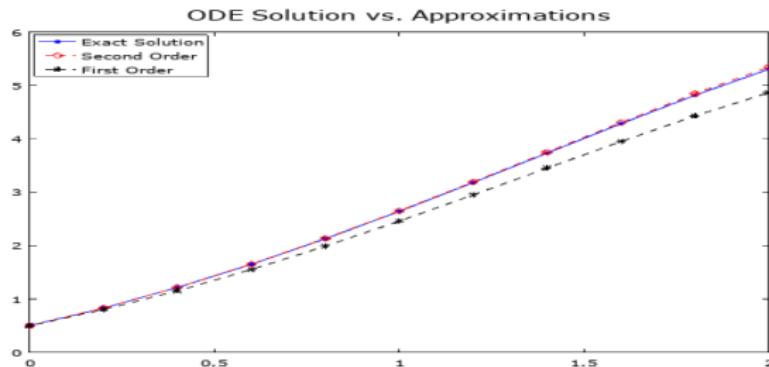

Euler's Method vs. Second Order Taylor Method: $N = 10$

$$\frac{dy}{dt} = f(t, y), \quad f(t, y) = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5.$$

Euler's Method vs. Second Order Taylor Method: $N = 10$

- ▶ Second order method looks more accurate.

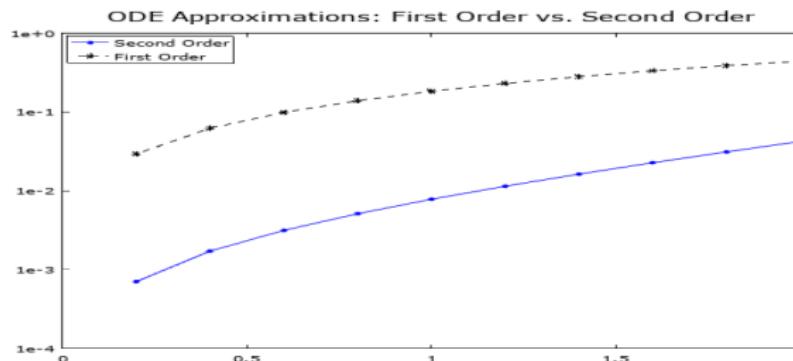

Euler's Method vs. Second Order Taylor Method: $N = 10$

- ▶ Second order method looks more accurate.

- ▶ Second order method has much smaller errors.

Runge-Kutta methods

With orders of Taylor methods yet without derivatives of $f(t, y(t))$

First order Taylor expansion in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D, \Delta_t = t - t_0, \Delta_y = y - y_0$. **Then**

$$f(t, y) = P_1(t, y) + R_1(t, y), \quad \text{where}$$

First order Taylor expansion in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D$, $\Delta_t = t - t_0$, $\Delta_y = y - y_0$. **Then**

$$f(t, y) = P_1(t, y) + R_1(t, y), \quad \text{where}$$

$$P_1(t, y) = f(t_0, y_0) + \Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0),$$

$$R_1(t, y) = \frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(\xi, \mu) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(\xi, \mu) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(\xi, \mu),$$

for some point $(\xi, \mu) \in D$.

Second order Taylor expansion in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D$, $\Delta_t = t - t_0$, $\Delta_y = y - y_0$. **Then**

$$f(t, y) = P_2(t, y) + R_2(t, y), \quad \text{where}$$

Second order Taylor expansion in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D$, $\Delta_t = t - t_0$, $\Delta_y = y - y_0$. **Then**

$$f(t, y) = P_2(t, y) + R_2(t, y), \quad \text{where}$$

$$\begin{aligned} P_2(t, y) &= f(t_0, y_0) + \left(\Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0) \right) \\ &\quad + \left(\frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(t_0, y_0) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(t_0, y_0) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(t_0, y_0) \right), \end{aligned}$$

Second order Taylor expansion in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D$, $\Delta_t = t - t_0$, $\Delta_y = y - y_0$. **Then**

$$f(t, y) = P_2(t, y) + R_2(t, y), \quad \text{where}$$

$$\begin{aligned} P_2(t, y) &= f(t_0, y_0) + \left(\Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0) \right) \\ &\quad + \left(\frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(t_0, y_0) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(t_0, y_0) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(t_0, y_0) \right), \end{aligned}$$

$$R_2(t, y) = \frac{1}{3!} \left(\sum_{j=0}^3 \binom{3}{j} \Delta_t^{3-j} \Delta_y^j \frac{\partial^3 f}{\partial t^{3-j} \partial y^j}(\xi, \mu) \right)$$

Example: Second order Taylor expansion in two variables

$$\begin{aligned}f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\&= P_2(t, y) + R_2(t, y), \quad \text{with } (t_0, y_0) = (2, 3).\end{aligned}$$

Example: Second order Taylor expansion in two variables

$$\begin{aligned}f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\&= P_2(t, y) + R_2(t, y), \quad \text{with } (t_0, y_0) = (2, 3).\end{aligned}$$

Let $\Delta_t = t - 2$, $\Delta_y = y - 3$,

$$\begin{aligned}P_2(t, y) &= f(t_0, y_0) + \left(\Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0)\right) \\&\quad + \left(\frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(t_0, y_0) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(t_0, y_0) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(t_0, y_0)\right)\end{aligned}$$

Example: Second order Taylor expansion in two variables

$$\begin{aligned}f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\&= P_2(t, y) + R_2(t, y), \quad \text{with } (t_0, y_0) = (2, 3).\end{aligned}$$

Let $\Delta_t = t - 2$, $\Delta_y = y - 3$,

$$\begin{aligned}P_2(t, y) &= f(t_0, y_0) + \left(\Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0) \right) \\&\quad + \left(\frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(t_0, y_0) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(t_0, y_0) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(t_0, y_0) \right) \\&= 1 - \frac{9}{4} \Delta_t^2 - 2\Delta_t \Delta_y - \frac{3}{4} \Delta_y^2.\end{aligned}$$

Example: Second order Taylor expansion in two variables

$$\begin{aligned}f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\&= P_2(t, y) + R_2(t, y), \quad \text{with } (t_0, y_0) = (2, 3).\end{aligned}$$

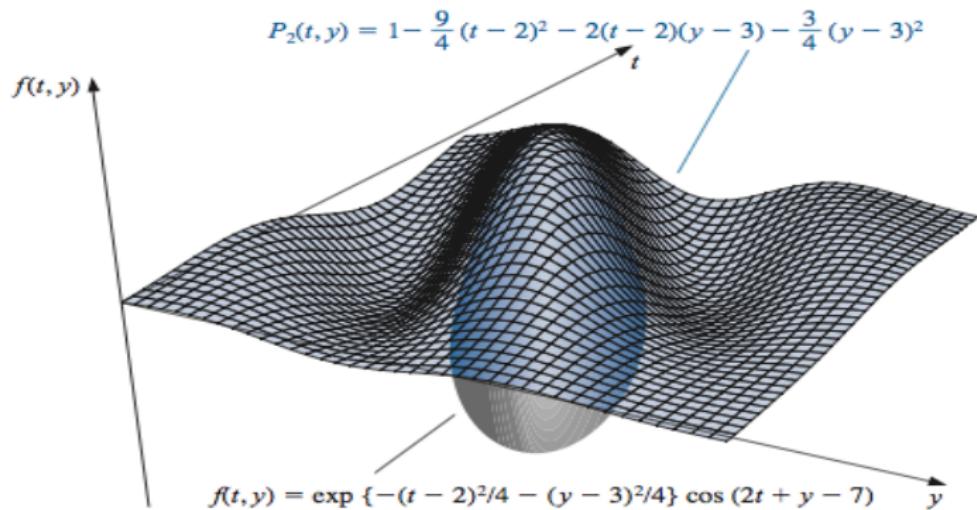

Let $\Delta_t = t - 2$, $\Delta_y = y - 3$,

$$\begin{aligned}P_2(t, y) &= f(t_0, y_0) + \left(\Delta_t \frac{\partial f}{\partial t}(t_0, y_0) + \Delta_y \frac{\partial f}{\partial y}(t_0, y_0) \right) \\&\quad + \left(\frac{\Delta_t^2}{2} \frac{\partial^2 f}{\partial t^2}(t_0, y_0) + \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(t_0, y_0) + \frac{\Delta_y^2}{2} \frac{\partial^2 f}{\partial y^2}(t_0, y_0) \right) \\&= 1 - \frac{9}{4} \Delta_t^2 - 2 \Delta_t \Delta_y - \frac{3}{4} \Delta_y^2.\end{aligned}$$

$$\text{so } f(t, y) \approx P_2(t, y) = 1 - \frac{9}{4}(t-2)^2 - 2(t-1)(y-3) - \frac{3}{4}(y-3)^2.$$

$$\begin{aligned}
 f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\
 &\approx 1 - \frac{9}{4}(t-2)^2 - 2(t-1)(y-3) - \frac{3}{4}(y-3)^2.
 \end{aligned}$$

$$\begin{aligned}
 f(t, y) &= \exp\left(-\frac{(t-2)^2}{4} - \frac{(y-3)^2}{4}\right) \cos(2t + y - 7) \\
 &\approx 1 - \frac{9}{4}(t-2)^2 - 2(t-1)(y-3) - \frac{3}{4}(y-3)^2.
 \end{aligned}$$

Approximation good near $(2, 3)$, bad elsewhere

Taylor's Theorem in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Let $(t_0, y_0), (t, y) \in D$, $\Delta_t = t - t_0$, $\Delta_y = y - y_0$. **Then** for $n \geq 1$,

$$f(t, y) = P_n(t, y) + R_n(t, y), \quad \text{where}$$

Taylor's Theorem in two variables

Theorem: Suppose that $f(t, y)$ and all its partial derivatives are

continuous on $D \stackrel{\text{def}}{=} \{(t, y) \mid a \leq t \leq b, c \leq y \leq d\}$

Runge-Kutta Method of Order Two (I)

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

Runge-Kutta Method of Order Two (I)

$$\frac{dy}{dt} = f(t, y), \quad a \leq t \leq b, \quad y(a) = \alpha.$$

- ▶ Second order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h \mathbf{T}^{(2)}(t_j, w_j), \quad j = 0, 1, \dots, N-1, \quad \text{where}$$

$$\begin{aligned}\mathbf{T}^{(2)}(t, y) &= f(t, y) + \frac{h}{2} f'(t, y) \\&= f(t, y) + \frac{h}{2} \left(\frac{\partial f}{\partial t}(t, y) + \frac{\partial f}{\partial y}(t, y) \frac{dy}{dt} \right) \\&= f(t, y) + \frac{h}{2} \left(\frac{\partial f}{\partial t}(t, y) + \frac{\partial f}{\partial y}(t, y) f(t, y) \right) \\&= f\left(t + \frac{h}{2}, y + \frac{h}{2} f(t, y)\right) - R_1\left(t + \frac{h}{2}, y + \frac{h}{2} f(t, y)\right)\end{aligned}$$

Runge-Kutta Method of Order Two (II)

- ▶ Second order Taylor method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h \mathbf{T}^{(2)}(t_j, w_j), \quad j = 0, 1, \dots, N-1, \quad \text{where}$$

$$\mathbf{T}^{(2)}(t, y) = f\left(t + \frac{h}{2}, y + \frac{h}{2}f(t, y)\right) - R_1\left(t + \frac{h}{2}, y + \frac{h}{2}f(t, y)\right),$$

- ▶ From first order Taylor expansion,

$$\begin{aligned} R_1\left(t + \frac{h}{2}, y + \frac{h}{2}f(t, y)\right) &= \frac{h^2}{8} \frac{\partial^2 f}{\partial t^2}(\xi, \mu) + \frac{h^2 f(t, y)}{4} \Delta_t \Delta_y \frac{\partial^2 f}{\partial t \partial y}(\xi, \mu) \\ &\quad + \frac{h^2 f^2(t, y)}{8} \frac{\partial^2 f}{\partial y^2}(\xi, \mu) = O(h^2). \end{aligned}$$

Method remains second order after dropping $R_1\left(t + \frac{h}{2}, y + \frac{h}{2}f(t, y)\right)$

Runge-Kutta Method of Order Two (III)

► Midpoint Method

$$w_0 = \alpha,$$

$$w_{j+1} = w_j + h f \left(t_j + \frac{h}{2}, w_j + \frac{h}{2} f(t_j, w_j) \right), \quad j = 0, 1, \dots, N-1.$$

- Two function evaluations for each j ,
- Second order accuracy.

No need for derivative calculations

General 2nd order Runge-Kutta Methods

- ▶ $w_0 = \alpha$; for $j = 0, 1, \dots, N - 1$,

$$w_{j+1} = w_j + h (a_1 f(t_j, w_j) + a_2 f(t_j + \alpha_2, w_j + \delta_2 f(t_j, w_j))).$$

General 2nd order Runge-Kutta Methods

- ▶ $w_0 = \alpha$; for $j = 0, 1, \dots, N - 1$,

$$w_{j+1} = w_j + h (a_1 f(t_j, w_j) + a_2 f(t_j + \alpha_2, w_j + \delta_2 f(t_j, w_j))).$$

- ▶ Two function evaluations for each j ,
- ▶ Want to choose $a_1, a_2, \alpha_2, \delta_2$ for highest possible order of accuracy.

General 2nd order Runge-Kutta Methods

- ▶ $w_0 = \alpha$; for $j = 0, 1, \dots, N - 1$,

$$w_{j+1} = w_j + h (a_1 f(t_j, w_j) + a_2 f(t_j + \alpha_2, w_j + \delta_2 f(t_j, w_j))).$$

- ▶ Two function evaluations for each j ,
- ▶ Want to choose $a_1, a_2, \alpha_2, \delta_2$ for highest possible order of accuracy.

local truncation error

$$\begin{aligned}\tau_{j+1}(h) &= \frac{y(t_{j+1}) - y(t_j)}{h} - (a_1 f(t_j, y(t_j)) + a_2 f(t_j + \alpha_2, y(t_j) + \delta_2 f(t_j, y(t_j)))) \\ &= y'(t_j) + \frac{h}{2} y''(t_j) + O(h^2) \\ &\quad - \left((a_1 + a_2) f(t_j, y(t_j)) + a_2 \alpha_2 \frac{\partial f}{\partial t}(t_j, y(t_j)) \right. \\ &\quad \left. + a_2 \delta_2 f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)) + O(h^2) \right).\end{aligned}$$

local truncation error

$$\begin{aligned}\tau_{j+1}(h) = & \quad y'(t_j) + \frac{h}{2}y''(t_j) + O(h^2) \\ & - \left((a_1 + a_2) f(t_j, y(t_j)) + a_2 \alpha_2 \frac{\partial f}{\partial t}(t_j, y(t_j)) \right. \\ & \quad \left. + a_2 \delta_2 f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)) + O(h^2) \right).\end{aligned}$$

where $y'(t_j) = f(t_j, y(t_j))$,

local truncation error

$$\begin{aligned}\tau_{j+1}(h) = & \quad y'(t_j) + \frac{h}{2}y''(t_j) + O(h^2) \\ & - \left((a_1 + a_2)f(t_j, y(t_j)) + a_2\alpha_2 \frac{\partial f}{\partial t}(t_j, y(t_j)) \right. \\ & \quad \left. + a_2\delta_2 f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)) + O(h^2) \right).\end{aligned}$$

where $y'(t_j) = f(t_j, y(t_j))$,

$$y''(t_j) = \frac{d f}{d t}(t_j, y(t_j)) = \frac{\partial f}{\partial t}(t_j, y(t_j)) + f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)).$$

For any choice with

$$a_1 + a_2 = 1, \quad a_2\alpha_2 = a_2\delta_2 = \frac{h}{2},$$

we have a second order method

$$\tau_{j+1}(h) = O(h^2).$$

local truncation error

$$\begin{aligned}\tau_{j+1}(h) = & \quad y'(t_j) + \frac{h}{2}y''(t_j) + O(h^2) \\ & - \left((a_1 + a_2)f(t_j, y(t_j)) + a_2\alpha_2 \frac{\partial f}{\partial t}(t_j, y(t_j)) \right. \\ & \quad \left. + a_2\delta_2 f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)) + O(h^2) \right).\end{aligned}$$

where $y'(t_j) = f(t_j, y(t_j))$,

$$y''(t_j) = \frac{d f}{d t}(t_j, y(t_j)) = \frac{\partial f}{\partial t}(t_j, y(t_j)) + f(t_j, y(t_j)) \frac{\partial f}{\partial y}(t_j, y(t_j)).$$

For any choice with

$$a_1 + a_2 = 1, \quad a_2\alpha_2 = a_2\delta_2 = \frac{h}{2},$$

we have a second order method

$$\tau_{j+1}(h) = O(h^2).$$

Four parameters, three equations

General 2nd order Runge-Kutta Methods

$w_0 = \alpha$; for $j = 0, 1, \dots, N - 1$,

$$w_{j+1} = w_j + h (a_1 f(t_j, w_j) + a_2 f(t_j + \alpha_2, w_j + \delta_2 f(t_j, w_j))).$$

$$a_1 + a_2 = 1, \quad a_2 \alpha_2 = a_2 \delta_2 = \frac{h}{2},$$

- ▶ **Midpoint method:** $a_1 = 0, a_2 = 1, \alpha_2 = \delta_2 = \frac{h}{2}$,

$$w_{j+1} = w_j + h f\left(t_j + \frac{h}{2}, w_j + \frac{h}{2} f(t_j, w_j)\right).$$

- ▶ **Modified Euler method:** $a_1 = a_2 = \frac{1}{2}, \alpha_2 = \delta_2 = h$,

$$w_{j+1} = w_j + \frac{h}{2} (f(t_j, w_j) + f(t_{j+1}, w_j + hf(t_j, w_j))).$$

3rd order Runge-Kutta Method (rarely used in practice)

$$w_0 = \alpha;$$

for $j = 0, 1, \dots, N - 1$,

$$\begin{aligned} w_{j+1} &= w_j + \frac{h}{4} \left(f(t_j, w_j) + 3f\left(t_j + \frac{2h}{3}, w_j + \frac{2h}{3}f(t_j + \frac{h}{3}, w_j + \frac{h}{3}f(t_j, w_j))\right) \right) \\ &\stackrel{\text{def}}{=} w_j + h \phi(t_j, w_j). \end{aligned}$$

3rd order Runge-Kutta Method (rarely used in practice)

$$w_0 = \alpha;$$

for $j = 0, 1, \dots, N - 1$,

$$\begin{aligned} w_{j+1} &= w_j + \frac{h}{4} \left(f(t_j, w_j) + 3f\left(t_j + \frac{2h}{3}, w_j + \frac{2h}{3}f(t_j + \frac{h}{3}, w_j + \frac{h}{3}f(t_j, w_j))\right) \right) \\ &\stackrel{\text{def}}{=} w_j + h\phi(t_j, w_j). \end{aligned}$$

local truncation error

$$\tau_{j+1}(h) = \frac{y(t_{j+1})y(t_j)}{h} - \phi(t_j, y(t_j)) = O(h^3).$$

4th order Runge-Kutta Method

$$w_0 = \alpha;$$

for $j = 0, 1, \dots, N - 1$,

$$k_1 = h f(t_j, w_j),$$

$$k_2 = h f\left(t_j + \frac{h}{2}, w_j + \frac{1}{2} k_1\right),$$

$$k_3 = h f\left(t_j + \frac{h}{2}, w_j + \frac{1}{2} k_2\right),$$

$$k_4 = h f(t_{j+1}, w_j + k_3),$$

$$w_{j+1} = w_j + \frac{1}{6} (k_1 + 2k_2 + 2k_3 + k_4).$$

4 function evaluations per step

Example

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$

exact solution $y(t) = (1 + t)^2 - 0.5 e^t.$

Example

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$
exact solution $y(t) = (1+t)^2 - 0.5 e^t.$

Example

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$

exact solution $y(t) = (1 + t)^2 - 0.5 e^t.$

Example

Initial Value ODE $\frac{dy}{dt} = y - t^2 + 1, \quad 0 \leq t \leq 2, \quad y(0) = 0.5,$
exact solution $y(t) = (1 + t)^2 - 0.5 e^t.$
